

# Creating and Managing Volumes

The following section provides the information you need to create and manage volumes within your SoftNAS Cloud® instance.

## Using Our Documentation

SoftNAS has organized its documentation according to task based and platform based documentation. This means you can find what you are looking for by simply selecting the subject you wish to know about, and drilling down to the appropriate location. Task based pages such as this one are organized into platforms, allowing you to narrow your focus to the content and platform relevant to you. Content that is common across platforms is listed in All Platforms, and content specific to, or primarily focused on a given platform is organized accordingly. The product itself is designed to provide a similar experience across each platform. If there is no content specific to a given platform (VMware (on-premise), AWS or Azure) , check the All Platforms section.
